Additional examples presented in class for well-ordered induction[1]:

- For every positive integer n, $\sum_{1 \leq i \leq n} i = \frac{n(n+1)}{2}$.

- Every positive integer greater than one has a prime divisor.

- Every positive non-prime integer greater than one can be factored as a product of primes.

- For positive integers m and n, the fraction $\frac{m}{n}$ can be written in lowest terms.
